International Trade in Crops with New Breeding Technologies:
The Australian Perspective

Building Capacity for Small Exporters to Exploit 'new breeding technologies'

Michael Jones

Professor of Agricultural Biotechnology

Crop Biotechnology Research Group

Centre for Crop and Food Innovation, Food Futures Institute

WA State Agricultural Biotechnology Centre

Murdoch University, Perth, Western Australia

**Department of Agriculture, Water and the Environment:
Package Assisting Small Exporters Program**

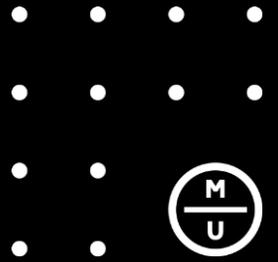

*Building Capacity for Small Exporters to
Exploit 'new breeding technologies'*

**Australia is a food
exporting nation**

The Project

- Department of Agriculture, Water and the Environment (DAWE)
 - Package Assisting Small Exporters (PASE)
- Project: 'Building Capacity for Small Exporters to Exploit 'New Breeding Technologies'
- Forward looking project with the primary aim of enabling Australian grains and horticultural industries to be first-movers in applying new breeding technologies to crop improvement
- Provide information on new science/technologies, and on the policies and regulations that relate to them both in Australia and with our trading partners
- Additional aim: to help promote international harmonisation of regulations and reduce barriers to trade

Australian wheat exports (average 2016-2020)

Top 10 countries,
70-80% of exports

Country	Amount (mmt)	Value (million)
Indonesia	2.5	739
Philippines	1.5	465
Vietnam	1.3	404
Korea	1.1	361
China	1.1	346
Japan	0.9	335
Malaysia	0.7	225
India	0.7	346
Yemen	0.6	200
New Zealand	0.5	158
TOTAL	14.4	4,600
(Domestic use)	8	

Source: AEGIC

Australian barley exports (average 2016-2020)

(Latest data not available)

Country	Amount (mt)	Value (million)
China	3,900	1,100,00
Japan	817	241
Thailand	250	78
Saudi Arabia	215	49
UAE	122	32
Vietnam	120	41
Kuwait	103	24
Qatar	44	14
Taiwan	38	11
Korea	29	8
Total	5,700	1,600
Domestic use	3,200	

Canola exports

Major export markets for Australian canola

Total exports \$1.56 billion 2.7 million tonnes

Sources: Export data: ABS (average 2015-18).
Domestic use data: ABARES (average 2014-15 to 2017-18).
\$ = AUD

Includes GM canola

Australian fruit and vegetable exports

Asia 77%

Asia* 607,343t (\$2,082.1)	
Grapes..... 141,948t (\$586.1m)	Cherries..... 4,039t (\$76.5m)

*Flower and nursery exports are recorded by each rather than weight, and so tonnes of these categories are not included in totals.

**Total includes exports with no specified country.

(Source Hort Innovation 2019-2020)

**But,
Australia is
an ancient
and
weathered
continent**

Challenges to crop production

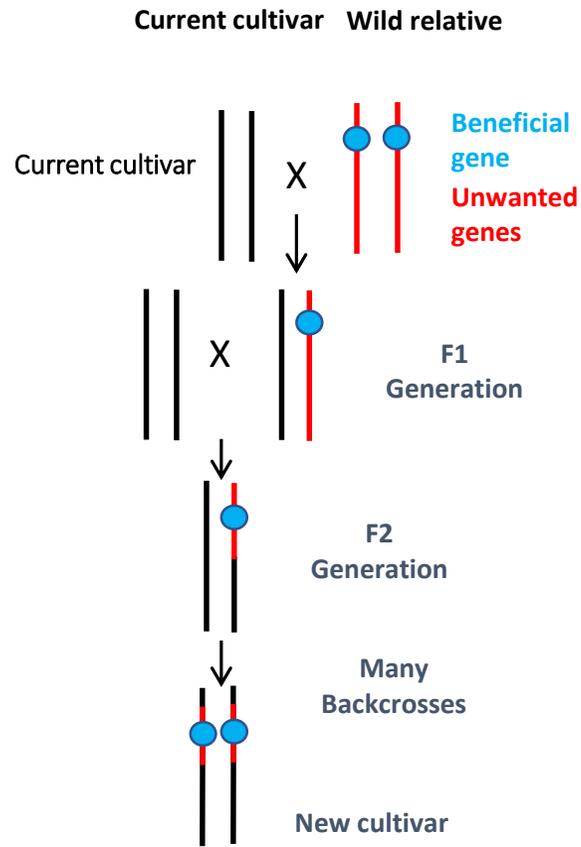

- Often water limited
- Soils often nutrient poor
- Drought and heat stress
- Prevention of incursions of new pests and diseases

 Need to apply the best science and technology to improve yields and quality, including gene-editing

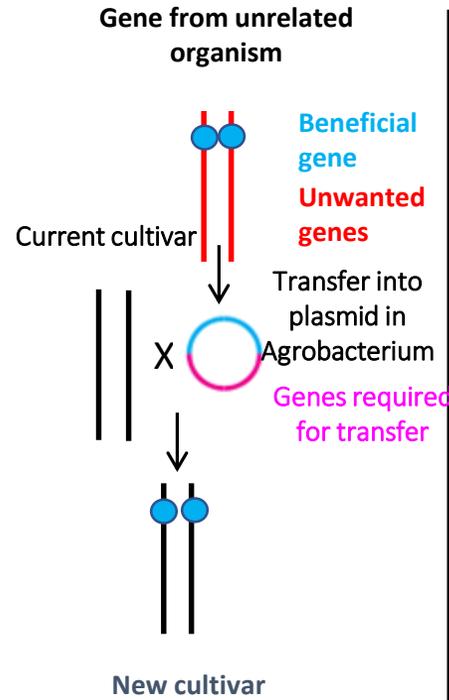

CONVENTIONAL AND NEW BREEDING TECHNOLOGIES

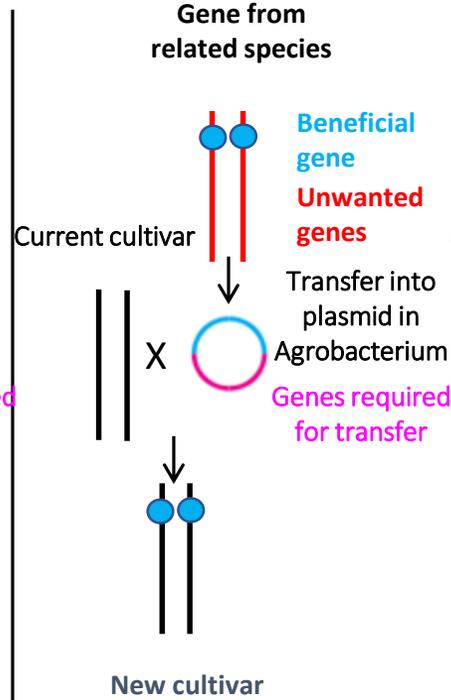

Conventional breeding

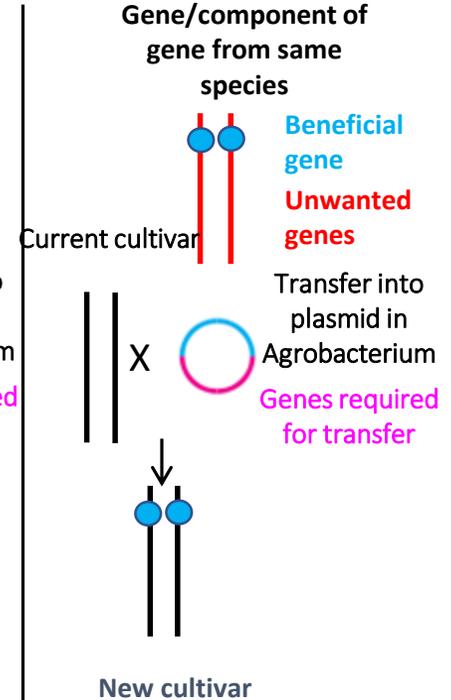

Transgenesis

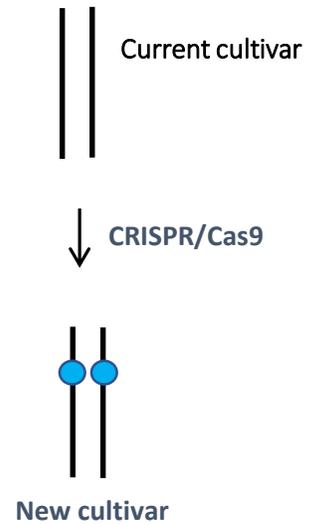

Cisgenesis

Intragenesis

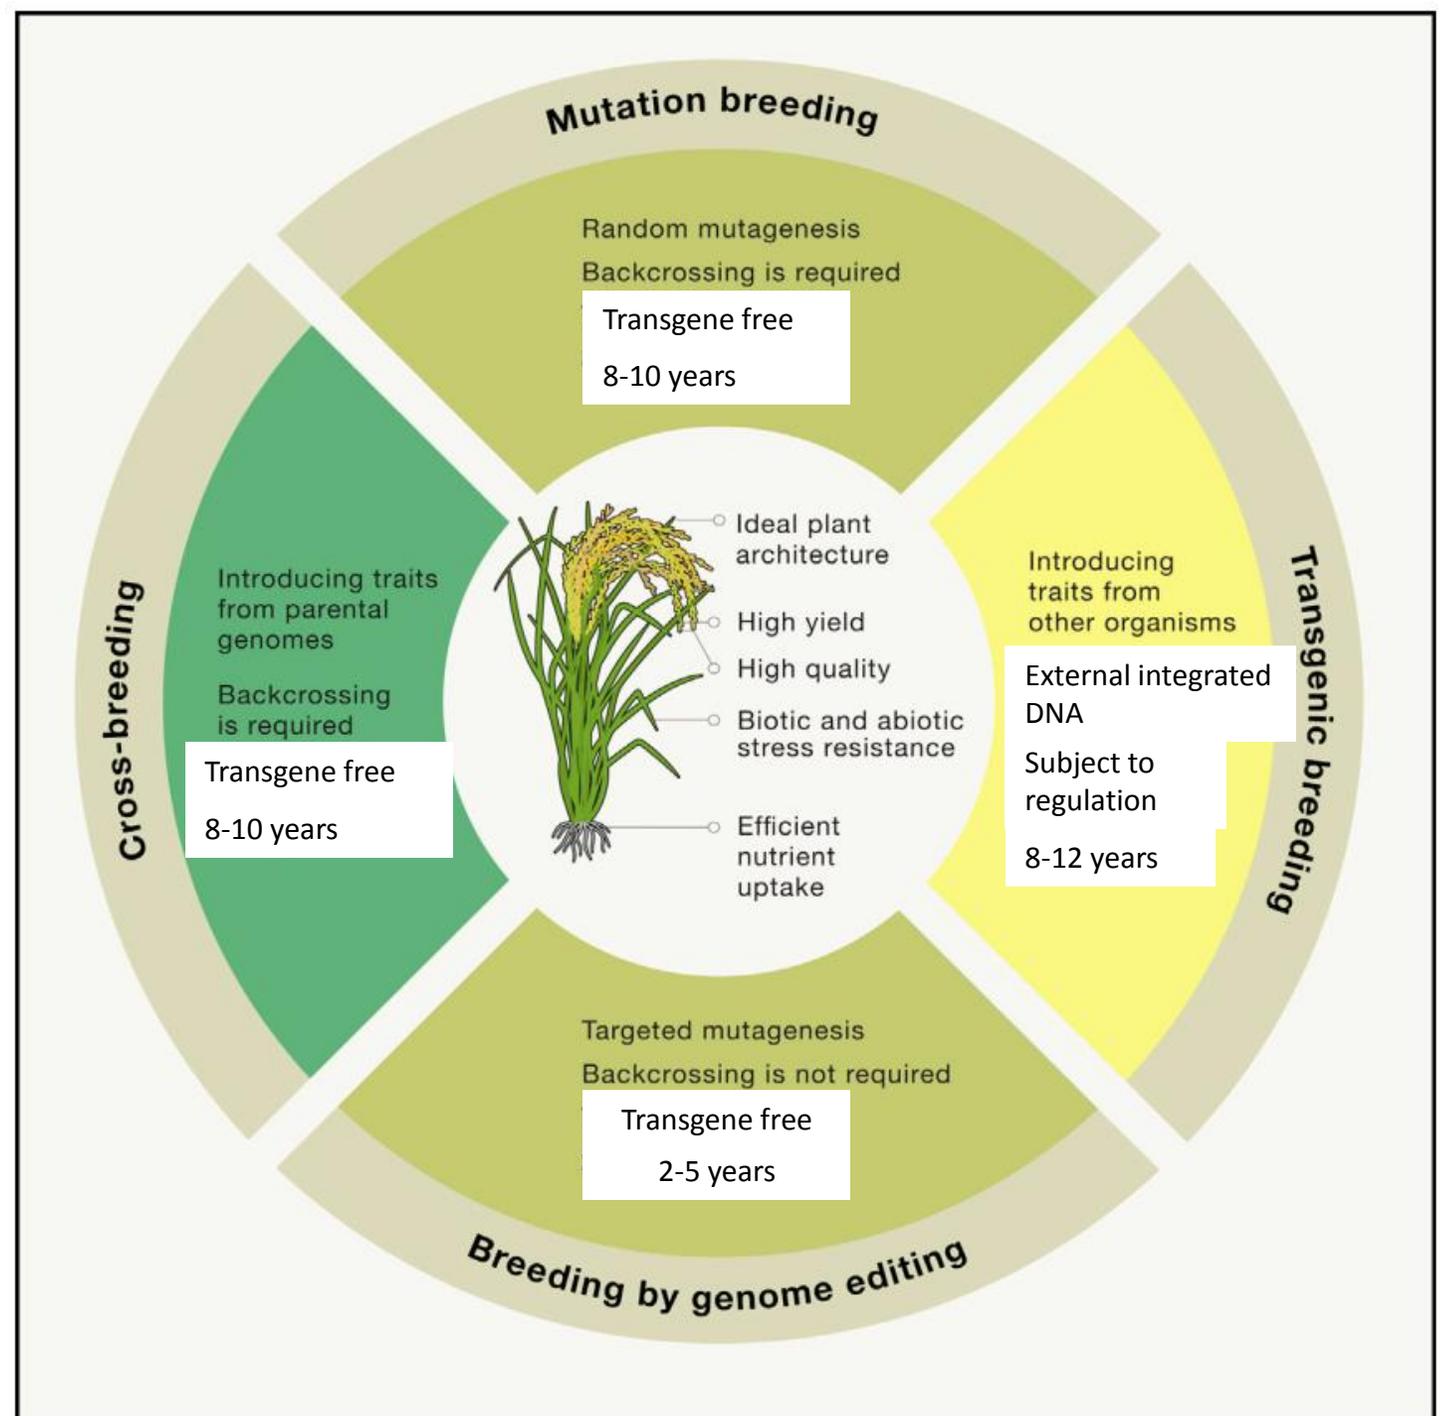

Gene-editing (SDN-1)

Genetically modified (GM) or Biotech Crops Gene-edited (GE) crops

A comparison of breeding technologies

Gao, Genome engineering for crop improvement and future agriculture, Cell (2021), <https://doi.org/10.1016/j.cell.2021.01.005>

Gene-editing technologies

- Zinc finger nucleases (ZFNs)
- Transcription activator-like effector nucleases (TALENs)
- Clustered regularly interspaced short palindromic repeat (CRISPR/Cas9)

These systems are based on the production and repair of double stranded breaks (DSBs) *via*

- non homologous end joining (NHEJ)
- homology-directed repair (HDR)

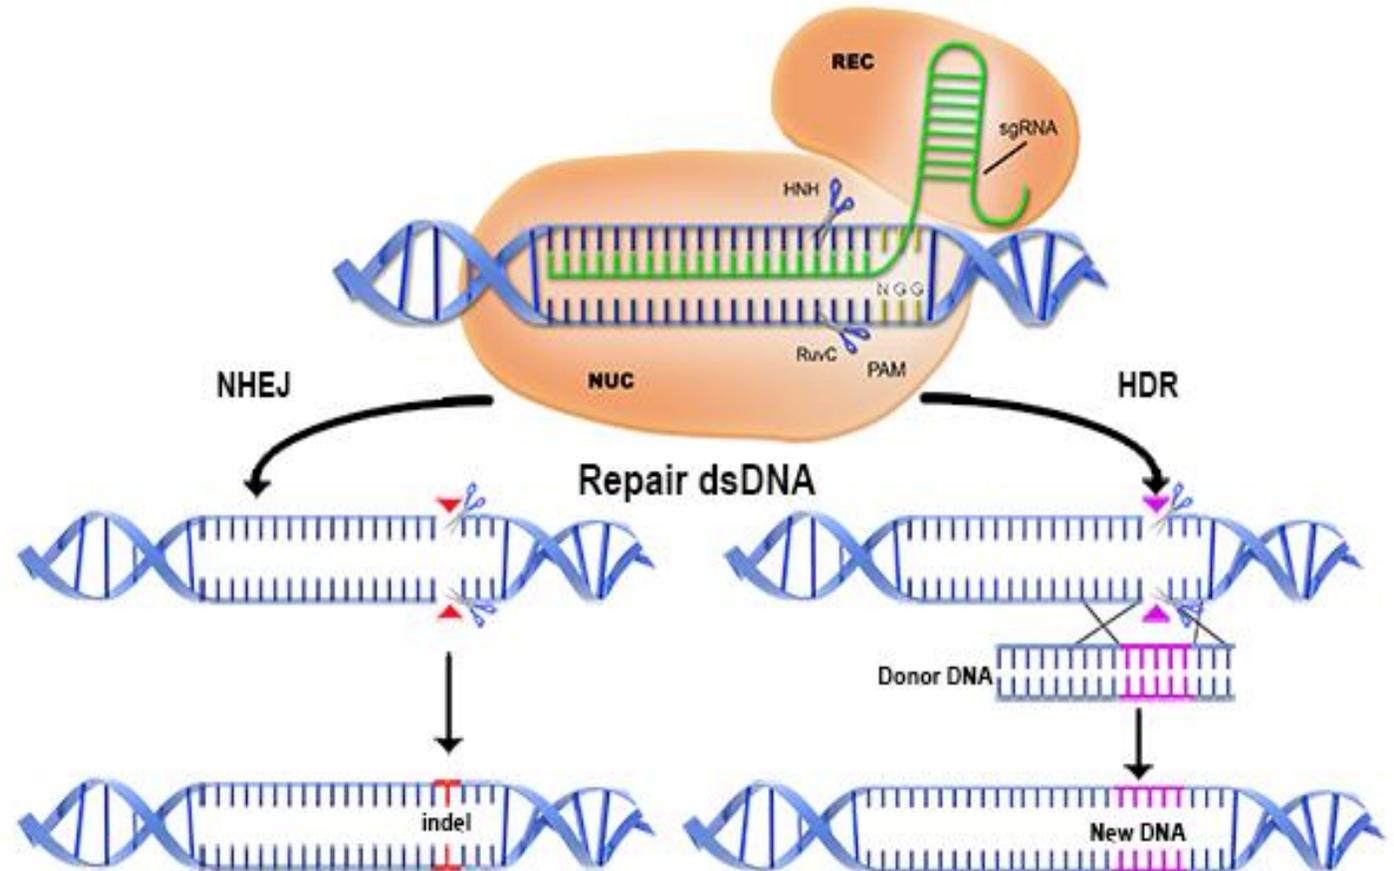

CRISPR-Cas9

CRISPR-Cas9 targeted double-strand DNA break

SDN-1 – non-homologous end joining (NHEJ) - natural repair mechanism, small nucleotide deletions, additions or substitutions

SDN-2 – in the presence of an oligonucleotide template with ends homologous to each side of the double-stranded break, homologous end joining (HEJ or HDR) can occur, such that one or more bases can be included in the repaired sequence

SDN-3 – as for SDN-2, but with a longer DNA insert, for example up to a full gene expression cassette

(Source: <http://www.labgene.ch/img/cms/AAT1/crispr-dual-editing-method.png>).

Other types of gene editing

Sequence deletion/insertion (SDN-1) or replacement

DNA free editing – Cas9 plus guide RNA (RNPs)

Base substitution

Prime editing

Gene segment deletion

Gene expression changes

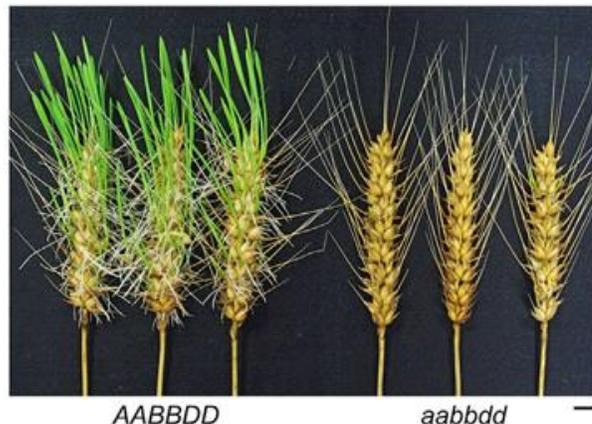

Epigenetic changes

The power SDN-1 gene editing for crop improvement

- *Gene-editing of all six MLO alleles in hexaploid bread wheat confers heritable, broad-spectrum resistance to powdery mildew (TaMLO-A1)(Wang et al, 2016, Nature Biotech)*

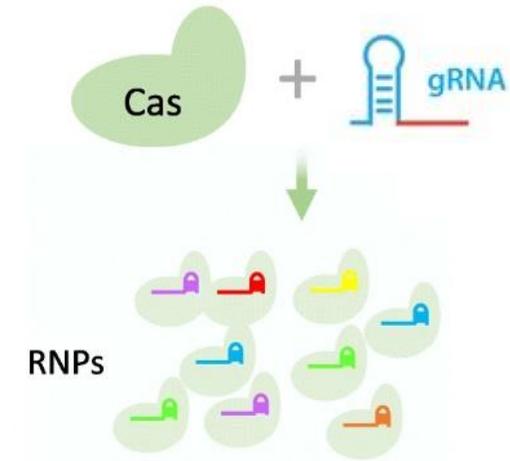

- *Gene-Edited Triple-Recessive Mutation Alters Seed Dormancy in Wheat (Abe et al Cell Reports 2019).*

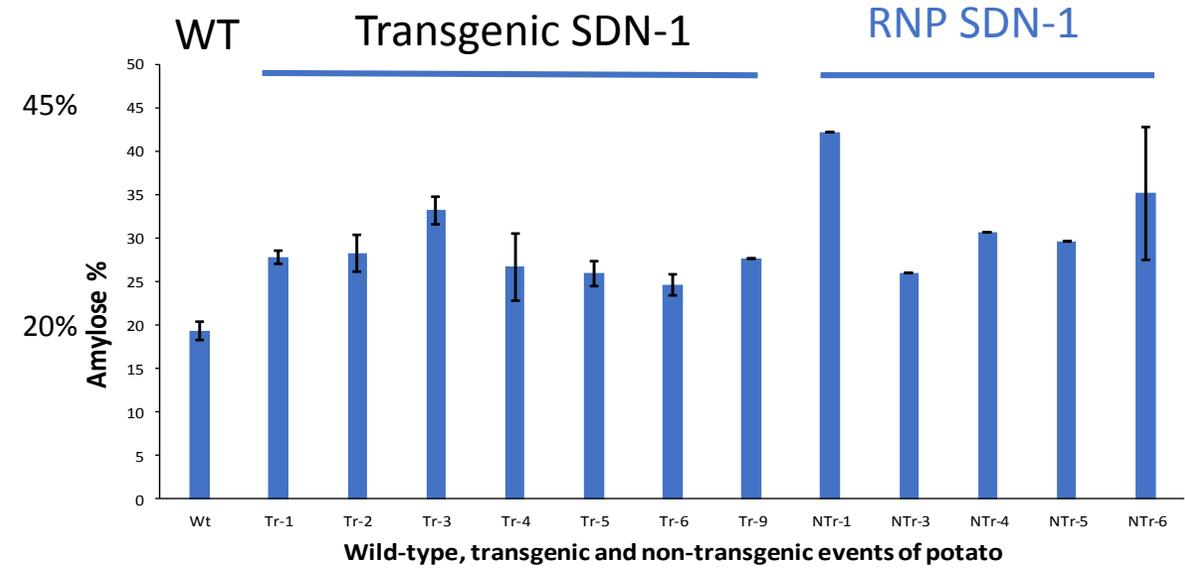

Left – pre-harvest sprouting, Right – edited to prevent pre-harvest sprouting (heads equally treated with water). Pre-harvest sprouting reduces grain quality and value.

Gene-edited potatoes without external DNA to improve the dietary quality – Sadia Iqbal

Particle bombardment

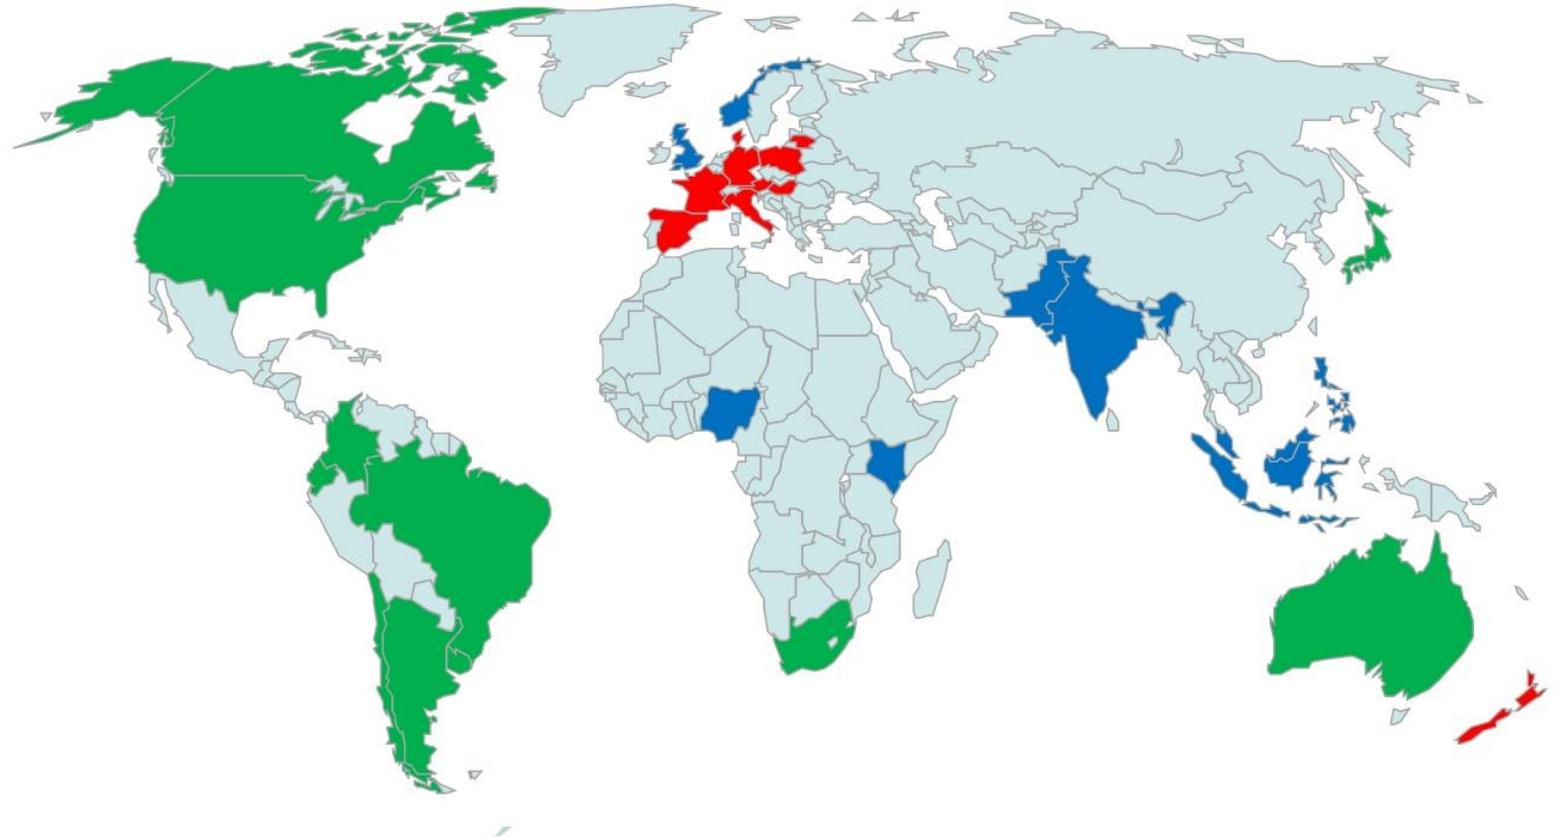

- GE targeting starch branching enzymes
- Amylose-resistant starch increased from 20% to 43% in RNP edited lines
- Slower glucose release helps reduce Type II diabetes, improves bowel health

Living organisms vs food products (Australia)

- **GM Living organisms** (GMOs or LMOs) - regulated in Australia by the *Gene Technology Act 2000* and administered by the Office of the Gene Technology Regulator (OGTR) – **SDN-1 de-regulated in Australia**
- **Food Products** are regulated in Australia - governed by *the Australia New Zealand Food Standards Code* and administered by Food Standards Australia New Zealand (FSANZ)
 - Food derived using new breeding techniques under review, public comment mid 2021
 - **FSANZ will consider applications for commercial GE food products**

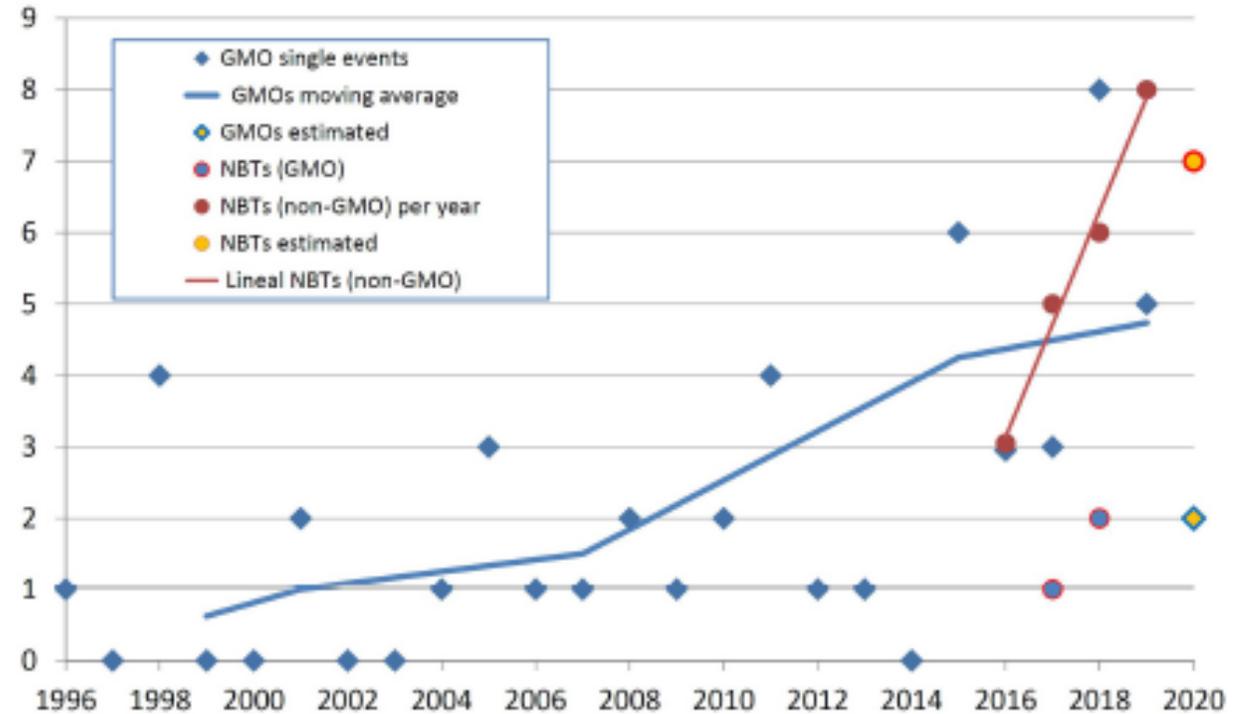

Current status of regulation of GE crops

- GE SDN-1 crops deregulated
- Ongoing discussion with recommendation to deregulate GE SDN-1 crops (progressing)
- GE crops regulated

GE regulations – Argentina, a case study

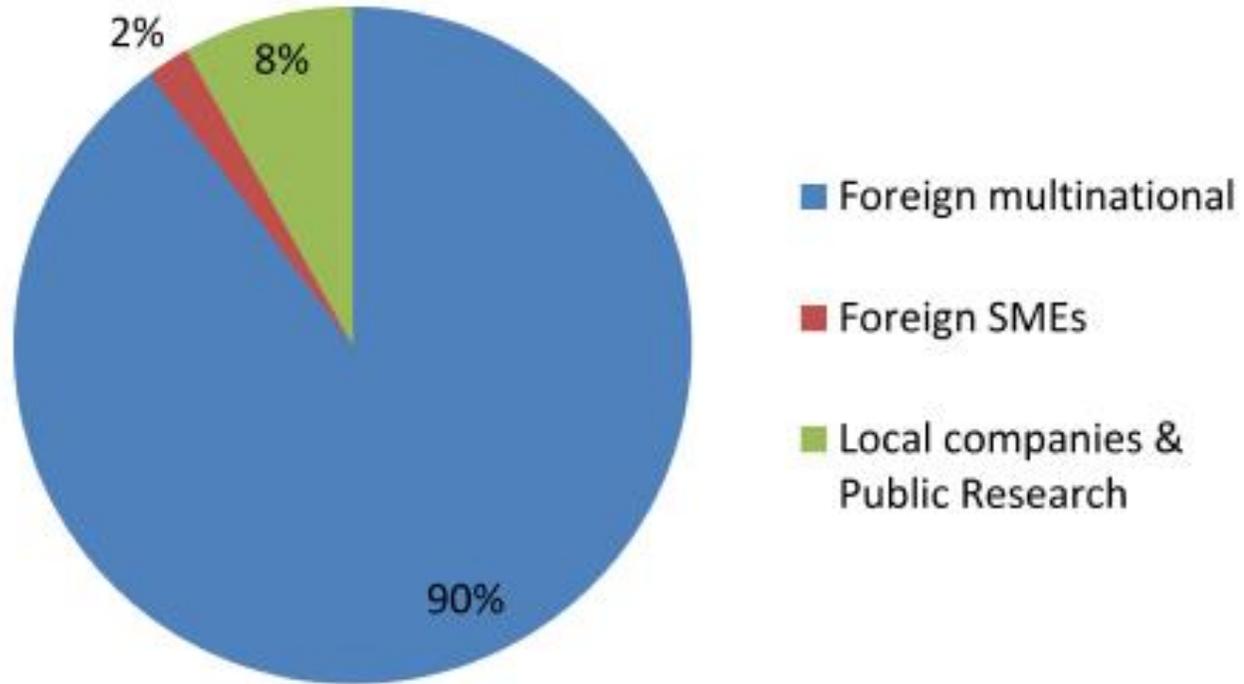

- Five years experience
- GE products: much faster development from bench to market than GMOs

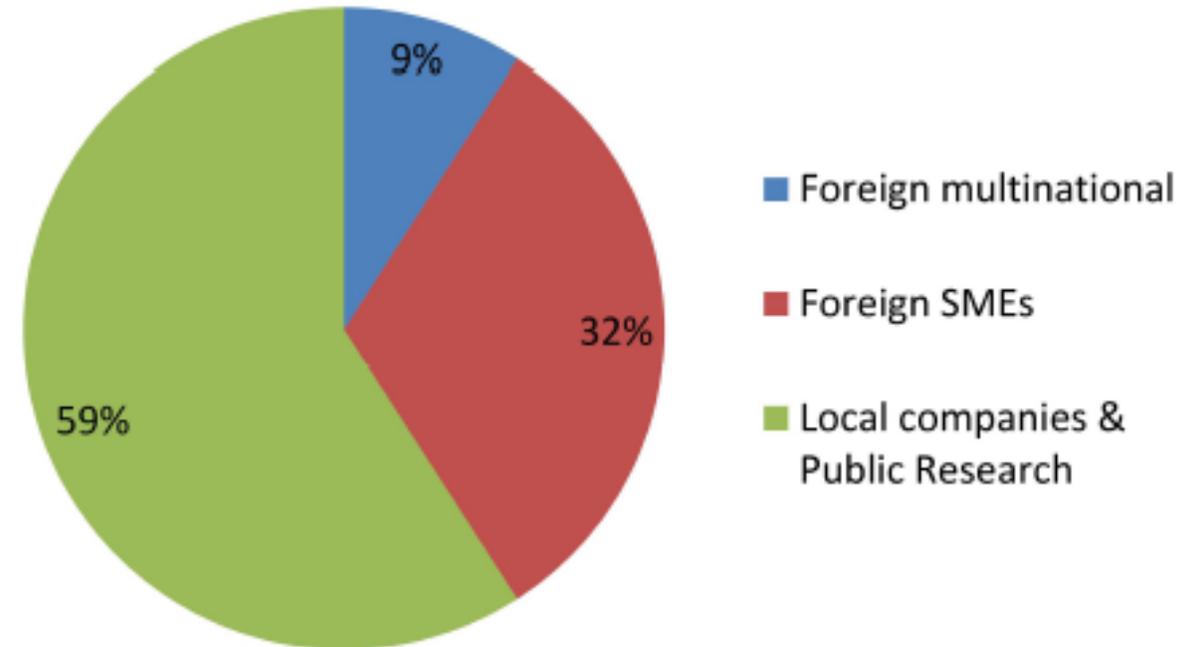

Whelan et al (2020). Gene editing regulation and innovation economics. *Frontiers in Bioengineering and Biotechnology*, doi: 10.3389/fbioe.2020.00303

Developer profiles: GM vs GE products

GMO products deregulated (20 years)

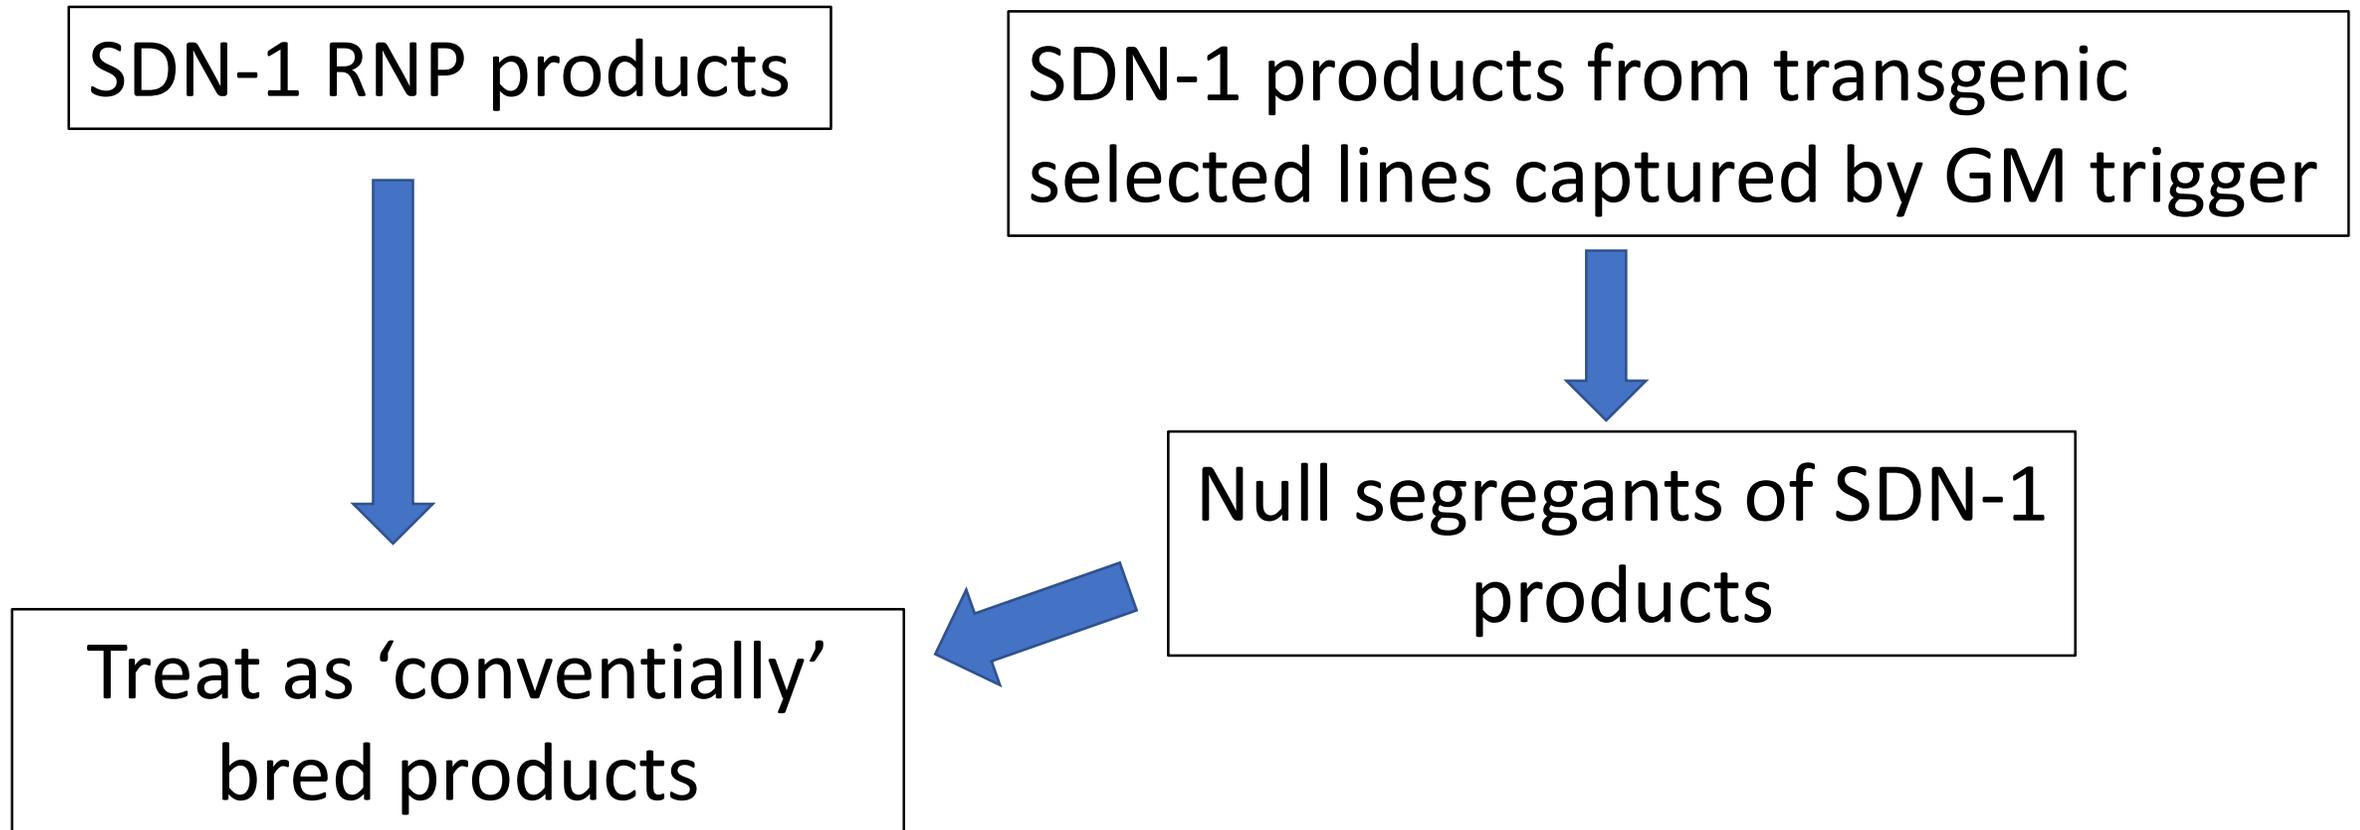

Gene-edited products deregulated (5 years)

- Mainly public institutions, public research and SMEs
- More diversified traits and plant species

Path-to-market, SDN-1 products (Australia, SE Asia)

The future

- FSANZ to accept SDN-1 gene-edited food (no external DNA) as non-GM
- No additional tier of regulations for gene-edited crops/products
i.e. same treatment for SDN-1 crops/food as conventional breeding
- Public acceptance of GE crops/foods
- Use the term 'gene-editing' rather than 'genome-editing'
- Counter EU influence on GE legislation
- Provide industry and government with updates and quality briefings
- Promote harmonisation of international regulations for GE crops/produce

Quote from a recent ISAAA webinar

- *‘Paradoxically, the main challenge facing genome editing is not scientific, but political’*
- *‘It defies logic why introducing one single mutation in a specific genomic locus with extreme precision using Cas effectors is subject to strict regulations in some countries, while introducing thousands of simultaneous mutations in a completely uncontrolled manner by chemical/physical random mutagenesis methods is not regulated’*

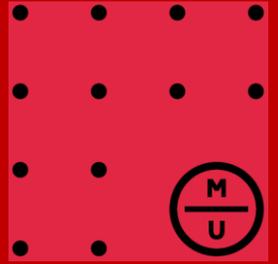

Jose Botella UQ, Brisbane, Australia (Zhan et al 2021, Genome editing for plant research and crop improvement, J Integrative Plant Biol <https://doi.org/10.1111/jipb.13063>)

Quote from a recent ISAAA webinar

- *‘Feeding the world is not a scientific problem – it’s a regulatory problem’*
- Professor Jim Whelan, LaTrobe University, Melbourne, Australia
